Customer Care Program

Remote analysis will explain your past and can predict your future

JBT Food & Dairy Systems has been producing machines for more than 100 years. In that time have been growing a lot of experience with machines in the field. In that time the process systems have become a lot smarter. Currently your machine is collecting very valuable data about your daily operation.

Analyze the details to find the big money

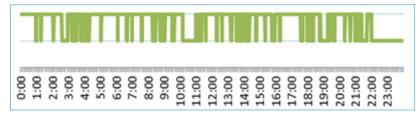

This collected data shows improvement opportunities in operation, maintenance, scheduling or even infrastructure. Therefore it can give you a good insight in how to increase your up-time, reduce your unscheduled downtime or even reduce maintenance costs.

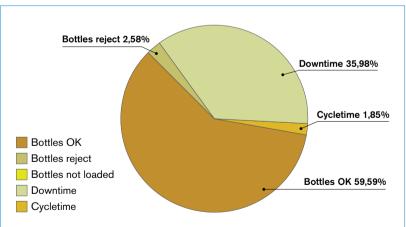

How to get there

To get the data and ensure continues improvement on your plant, we offer regular checks for your machine. We will start with a remote initial investigation in the first week of the contract. Two weeks later we will schedule a visit by a JBT engineer to investigate the state of the machine and how the maintenance is implemented. Specific checks will also be done, based on the remote initial investigation.

The follow-up and results

Based on the bi-weekly analysis several actions will be concluded and need to be discussed. Therefore every analysis ends with a WebEx meeting with the customer key persons where we discuss our findings and propose the next steps. These steps could be, to investigate physical areas of the machine, improvements in recipes, changes in production schedule or even changes on the machine. This will result in a higher OEE. Please contact your JBT Customer Care manager for more information.
